

## The Great Escape

Plants are living things. Like all living things, they reproduce, which means they make new plants just like themselves. A lot of plants do this by making seeds.

Seeds have to travel to new pieces of ground to grow into new plants.

Some seeds hang on to animal fur, and travel with them.

Some seed pods explode and throw the seeds into the air.

Some have 'parachutes' fixed to them, and blow in the wind.

Coconuts travel by sea.
